

# Centralised extraction

**Centralised industrial extraction has always been a major concern in the cleaning industry.**

Today, safety, hygiene and productivity standards call for high-performance centralised systems that can be effectively added to existing dust collection systems.

## Centralised extraction

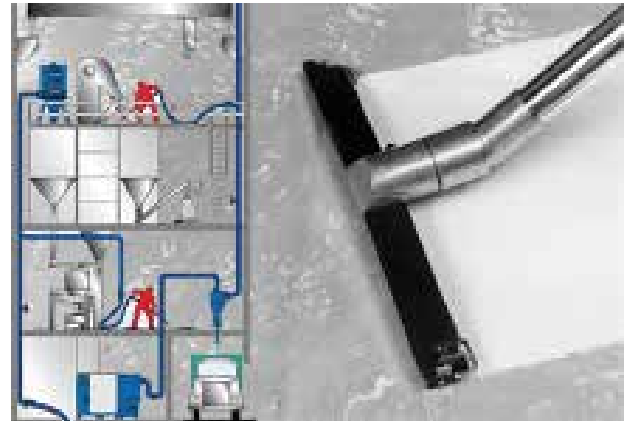

A centralised extraction system effectively sucks up the dust generated throughout your process, providing complete cleaning of the floor, equipment and production machinery.

Thanks to software specially developed by Delta NEU, the central extraction circuits are optimally sized and balanced, taking into account your specific needs, the characteristics of your environment and the type of differential pressure device to be used.

### WITH A CENTRALISED EXTRACTION SYSTEM, YOU CAN:

- Complete cleaning of the floor, as well as your production equipment and machinery.
- Influence ATEX classification zoning, reducing the presence of hazardous materials and minimising the risk of explosion and fire in the workplace.
- Improve working conditions and productivity by eliminating dust and creating a safer, healthier environment.
- Recover or recycle dust generated in the process, contributing to more efficient use of resources.

### A PLUS: THE DELSTART SYSTEM

Based on the same principle as the "Start and Stop" function found in many cars, Deltastart:

- provides an optimal cleaning experience.
- has automatic start-up of the differential pressure device as soon as a cleaning accessory is connected to the circuit.
- makes it easy to use and provides efficient energy management.
- guarantees a quick return on investment by generating significant energy savings.
